

SUS KIGALI HAIRCUT

Website & Business Management System — Full Documentation

Prepared for implementation. All amounts shown in Rwandan Francs (RWF) — adjust if a different currency applies.

1. Project Overview

SUS KIGALI HAIRCUT needs two connected systems:

1. A public website — classic, professional, good-looking — where clients learn about the salon, see services and prices, and book appointments.
2. An admin dashboard — the operational brain of the business — where the owner manages every worker, records every service performed, and automatically calculates each worker's earnings.

The salon is not barbering-only — it also offers female hair services (braiding, weaving, styling, treatments) and nail services (manicure/pedicure). Every module in this document — worker management, transaction recording, commission calculation, payroll, calendar tracking — is built to handle all worker types the same way, not barbers only.

The core business rule stated by the owner:

Every worker earns 20% commission on every service they perform. The standard barber haircut price is 10,000 RWF, meaning the barber earns 2,000 RWF and the salon keeps 8,000 RWF per standard cut. The same commission logic applies to hairstylists and nail technicians, on their own service menus and prices.

This documentation treats that rule as the default, but builds it as a configurable setting, not a hardcoded number — so prices, commission rates, worker categories, and service types can change as the business grows, without needing a developer to edit code every time.

2. Brand & Design Direction

The site should feel like a heritage barbershop, not a trendy startup — confident, disciplined, and craft-focused.

- Color palette: black + deep burgundy/maroon red + gold or cream accents (classic barber-pole colors), on an off-white or warm neutral background for readability.
- Typography: a strong serif or slab-serif for headings (signals tradition and craft), paired with a clean, modern sans-serif for body text and UI.
- Visual motifs: subtle barber-pole stripe accents, scissors/razor line icons, wood or leather-textured panels, black-and-white or warm-toned photography of real cuts and the real shop.
- Tone: masculine, trustworthy, precise — generous whitespace, no clutter, no stock-photo feel.

- Mobile-first: most bookings will come from phones — the layout must be flawless on small screens before anything else.
-

3. Frontend Website

3.1 Site Map

Page	Purpose	Key elements
Home	First impression, drive bookings	Hero banner with logo & tagline, "Book Now" CTA, featured services, top barbers preview, testimonial snippet, opening hours & location strip
About	Build trust	Salon story, mission, shop photos, years in business
Services & Pricing	Set expectations, reduce phone calls	Full menu with prices and durations, grouped by category
Our Team	Let clients pick their barber, hairstylist, or nail technician	Photo, name, role (Barber / Hairstylist / Nail Technician), specialty, experience, rating, "Book with [Name]", filterable by service type
Gallery	Show quality of work	Before/after shots, shop interior, categorized by style
Book Appointment	Convert visitors to clients	Service → barber → date/time → contact details → confirm
Testimonials	Social proof	Client reviews, star ratings
Contact & Location	Make it easy to find/reach	Google Maps embed, phone, WhatsApp button, hours, social links
(Optional) Hair Tips / Blog	SEO + engagement	Grooming tips, style trend posts

3.2 Booking Flow (Client Side)

1. Client selects a service (e.g., Classic Haircut).
2. Client selects a worker — the list filters automatically to whoever performs that service (barber, hairstylist, or nail technician) — or "Any available."
3. Client picks a date and time from real-time availability (blocks out slots the worker is already booked for).
4. Client enters name and phone number (account optional, but phone is required for reminders).
5. Booking is confirmed on screen and via SMS/WhatsApp confirmation.
6. An automatic reminder is sent 1–2 hours before the appointment.

7. On arrival, the booking is marked "completed" in the admin dashboard, which is what triggers the commission calculation (see Section 5).

3.3 Non-negotiable frontend requirements

- Fully responsive (phone, tablet, desktop).
 - Fast load time — compressed images, no heavy unused libraries.
 - Click-to-call and click-to-WhatsApp buttons visible on every page (common client behavior in Kigali).
 - Prices always shown in RWF, kept in sync with the admin dashboard's service list (never hardcoded twice).
 - Clear, single "Book Now" button repeated in the navigation bar and hero section.
-

4. Admin Dashboard

4.1 Roles & Permissions

Role	Access
Super Admin (Owner)	Full access: staff, services, all transactions, payroll, financial reports, settings, user management
Manager	Day-to-day operations: bookings, transaction recording, client management, inventory. Financial visibility configurable (e.g., can see total revenue but not individual payroll breakdowns)
Worker (optional login)	Any barber, hairstylist, or nail technician sees only their own schedule, their own client history, and their own earnings — cannot see other workers' numbers or shop-wide financials

Giving workers their own login (even view-only) is strongly recommended — it builds trust ("I can see exactly what I earned and why") and cuts down on disputes.

4.2 Dashboard Modules

a) Overview / Home Today's revenue, today's appointments, clients served today, top-performing worker today, revenue trend chart (7/30 days), low-stock alerts, upcoming appointments — the single-glance view of the business.

b) Staff / Worker Management This is not a "barbers list" — it's a full worker register for everyone who earns money for the salon: barbers, hairstylists (female hair — braiding, weaving, treatments, styling), nail technicians (manicure/pedicure), and any future category (e.g., makeup artist). Add, edit, or deactivate any worker regardless of type, all from the same screen.

Each profile stores: name, phone, photo, worker category (Barber / Hairstylist / Nail Technician / Other), specialty, start date, pay type (commission / fixed salary / hybrid — see Section 5.5), and commission rate (defaults to 20%, overridable per worker or per category — e.g., barbers at 20%, a senior hairstylist at 25%, a new nail technician at 15%).

Includes a performance view per worker: total clients, total revenue generated, total commission earned — filterable by day/week/month/year, and filterable by category so the owner can compare "barbers vs. hairstylists vs. nail technicians" side by side.

c) Service & Pricing Management Create, edit, deactivate services (name, price, duration, category). This is where "Classic Haircut = 10,000 RWF" lives — change it here and it updates everywhere (website, booking, commission calculations) automatically.

d) Transaction Recording (the daily-use screen) This is the most-used screen in the whole system — a quick "record a service" form, used identically whether it's a haircut, a braid, or a manicure:

- Select worker (list can be filtered by category — Barber / Hairstylist / Nail Technician)
- Select service(s) — supports multiple services in one visit (e.g., haircut + beard trim, or manicure + pedicure)
- Select or add client (optional, but recommended for CRM/loyalty tracking)
- Payment method (Cash / MTN MoMo / Airtel Money / Card)
- Discount, if any (requires a reason — for audit purposes)
- Submit

The system then automatically calculates: total amount charged, commission owed to the worker, and amount retained by the salon — instantly, with zero manual math.

e) Payroll & Commission Management Auto-generated payroll per worker per pay period (weekly, bi-weekly, or monthly — owner's choice), covering barbers, hairstylists, and nail technicians the same way. Shows number of clients served, service breakdown, gross revenue generated, commission earned, any bonuses/deductions, and net pay. One click to mark as paid and generate a payslip. Full payment history log per worker.

f) Client Management (mini-CRM) Client database with visit history, preferred worker(s), preferred style/notes, phone number (for reminders and marketing), visit count, and loyalty status.

g) Appointment / Booking Management Calendar view (day/week/month) of all bookings from the website plus walk-ins added directly by staff. Confirm, reschedule, cancel, or mark no-show.

h) Inventory Management Track shop products (clippers, blades, shampoo, pomade, towels, oils). Stock levels with automatic low-stock alerts so the owner never runs out mid-week.

i) Expense Management Record recurring and one-off expenses (rent, electricity, water, product restocking, equipment repair) so the dashboard can show true profit, not just revenue.

j) Reports & Analytics Revenue reports (daily/weekly/monthly/yearly), worker performance comparisons (filterable by category), most popular services, busiest hours/days, client retention rate. Exportable to Excel/PDF for the owner's records or for a bank/loan application.

k) Reviews & Feedback View and respond to client reviews; flag recurring issues per worker.

l) Notifications & Marketing Send promotional SMS/WhatsApp blasts, automated appointment reminders, birthday discount messages.

m) Settings Business info, working hours, holidays, default commission rate, worker categories, user roles, tax/report settings.

n) Calendar & Sales Trends View A calendar (month view by default, switchable to week or day) where every day shows a quick summary: total income earned, total commission paid out, and number of clients served that day. Days are color-coded by revenue (a simple heatmap) so the owner can spot patterns at a glance — which days of the week are busiest, slow periods, and whether sales are growing or shrinking over time.

Click into any day to see the full breakdown: transactions by worker, by service, and by worker category (barbers vs. hairstylists vs. nail technicians) — so the owner can see, for example, whether nail services are trending up this month compared to last.

The same calendar view, filtered to a single worker, doubles as a live salary tracker: instead of only seeing a total at the end of the pay period, the owner (or the worker themselves, if logged in) can

watch that worker's commission accrue day by day as the period progresses. Any selected date range can be exported to Excel/PDF.

(This module directly answers "track daily income and salaries" and "see sales over time" — it's the calendar-based view of everything the Overview and Reports modules summarize in numbers.)

5. Commission & Payroll Engine

This is the heart of "managing the money" — it has to be transparent, automatic, and dispute-proof.

5.1 Core Formula

```
commission_amount = service_price × commission_rate    (default 20%)
salon_amount      = service_price × (1 - commission_rate)
```

This formula applies to every worker, regardless of category — barber, hairstylist, or nail technician — using that worker's own commission rate against that service's own price.

5.2 Worked Example — Standard Cut

Service	Price (RWF)	Worker (20%)	Salon (80%)
Classic Haircut	10,000	2,000	8,000

5.3 Worked Example — Full Service Menu, All Categories

Since the salon sells more than haircuts, commission is calculated per line item, per worker category, then summed:

Service	Category	Price (RWF)	Worker Commission (20%*)	Salon Revenue
Classic Haircut	Barber	10,000	2,000	8,000
Beard Trim	Barber	5,000	1,000	4,000
Haircut + Beard Combo	Barber	13,000	2,600	10,400
Kids Haircut	Barber	7,000	1,400	5,600
Hair Coloring/Dye	Barber	15,000	3,000	12,000
Braiding / Weaving	Hairstylist	20,000	4,000	16,000
Hair Treatment	Hairstylist	12,000	2,400	9,600
Manicure	Nail Technician	6,000	1,200	4,800
Pedicure	Nail Technician	8,000	1,600	6,400

**Shown at the default 20% rate — the actual rate can vary by worker or category (see 5.5).*

(These service names, categories, and prices are illustrative — the real menu is entered by the owner in Service Management.)

5.4 Worked Example — One Worker's Payroll Slice

Client Visit	Service	Price	Commission (20%)
1	Classic Haircut	10,000	2,000
2	Classic Haircut	10,000	2,000
3	Beard Trim	5,000	1,000
4	Combo	13,000	2,600
5	Classic Haircut	10,000	2,000
Total for the day		48,000	9,600

At the end of a pay period, the system simply sums every completed transaction attributed to that worker. No spreadsheets, no manual tallying.

5.5 Rules That Should Be Configurable, Not Hardcoded

- Commission rate per worker or category — default 20%, but overridable per individual (e.g., a senior/master barber at 25%, a new apprentice at 15%) or set differently by category (e.g., barbers at 20%, hairstylists at 22%, nail technicians at 18% — whatever the owner decides).
- Fixed-salary staff — a receptionist or cleaner isn't paid by commission. Each staff profile should have a pay type: `commission`, `fixed salary`, or `hybrid` (small base + commission), so the same dashboard runs payroll for the whole team, not just service workers.
- Service-to-category restriction — decide whether a service can only be booked with its matching worker category (e.g., only nail technicians can be booked for a manicure) or is open to any trained worker. Recommended default: restricted by category, with a manual override per worker for anyone cross-trained.
- Discounts — decide whether commission is calculated on the *discounted* price or the *full* price. Recommendation: calculate on the amount actually paid, so the salon and worker share the discount fairly — but this should be a toggle the owner can flip.
- Tips — recommend tips are tracked separately and go 100% to the worker, not folded into the 20/80 split.
- No-shows/cancellations — no commission, since no service occurred.
- Corrections — any edit or void of a recorded transaction should require admin approval and leave an audit trail (who changed what, and when), to prevent disputes or fraud.

5.6 Payroll Cycle (Automated)

1. Owner sets the pay period (weekly / bi-weekly / monthly) once in Settings.
2. Every completed transaction is tagged to a worker and a date automatically as it's recorded.
3. At the end of each period, the system auto-generates a payroll summary per worker: clients served, revenue generated, commission earned, bonuses/deductions, net pay.
4. Owner reviews and clicks "Approve & Pay."
5. A payslip is generated and the worker's payment history is updated — visible to that worker if they have a login.

The Calendar & Sales Trends view (Section 4.2n) shows this same accrual day by day throughout the period, instead of only as a lump sum at the end.

6. Recommended Features to Grow the Business & Cut Manual Work

Grouped by what they achieve:

Client experience & retention

- Real-time online booking with live worker availability, across all categories
- SMS/WhatsApp booking confirmations and reminders (WhatsApp is the dominant channel in Kigali — a WhatsApp Business API integration pays for itself quickly)
- Loyalty program (e.g., every 10th standard cut discounted or free — tracked automatically per client)
- Referral rewards (client gets credit when they bring a friend)
- Mobile Money payment integration (MTN MoMo, Airtel Money) for deposits or full payment
- Digital queue display for walk-ins, showing estimated wait time
- Birthday/anniversary automatic discount messages
- Multi-language support (English, Kinyarwanda, French)

Staff & operations automation

- Clock-in/clock-out attendance tracking, optionally linked to punctuality bonuses
- Automated payroll and payslip generation (Section 5)
- Shift scheduling / roster management
- Worker performance leaderboard across all categories (gamifies growth — top earner of the month, best-rated hairstylist, etc.)
- Low-stock inventory alerts so supplies never run out mid-week

Financial control

- Automatic profit & loss statement (revenue – commissions – expenses)
- Full expense tracking (rent, utilities, restocking)
- Downloadable financial reports (Excel/PDF) for taxes or loan applications
- Audit trail on every transaction edit or void

Marketing & growth

- Promo codes and time-limited discounts (e.g., slow Tuesday afternoons)
- SMS/WhatsApp marketing campaigns to past clients
- Auto-posting before/after photos to social media (with client consent)
- Customer segmentation (frequent vs. one-time clients) for targeted offers

Analytics & insight

- Peak hour/day analysis to optimize staffing
- Most popular services and trending styles
- Client retention rate over time
- Per-worker and per-category revenue and client-count trends over time

Security & reliability

- Role-based access control (Section 4.1)
- Automatic daily cloud backups
- Encrypted passwords and secure login

- Multi-branch readiness — if SUS KIGALI HAIRCUT opens a second location later, the same system should support it without a rebuild

7. Data Model (Database Schema Overview)

Entity	Key Fields
Users	id, name, phone, email, role, password (hashed), status
Workers	id, user_id, full_name, phone, photo, category (Barber / Hairstylist / Nail Technician / Other), specialty, commission_rate, pay_type, date_joined, status
Services	id, name, description, price, duration_minutes, category (maps to worker category), active
Transactions	id, worker_id, service_id(s), client_id, amount, commission_amount, salon_amount, payment_method, discount, date, time
Clients	id, name, phone, email, preferred_worker_id, visit_count, total_spent, loyalty_points
Appointments	id, client_id, worker_id, service_id, date, time, status, source (online/walk-in)
Payroll	id, worker_id, period_start, period_end, total_clients, gross_revenue, commission_earned, bonus, deductions, net_pay, status, paid_date
Expenses	id, category, description, amount, date, recorded_by
Inventory	id, item_name, category, quantity, unit, reorder_level, unit_cost
Reviews	id, client_id, worker_id, rating, comment, date
Attendance	id, worker_id, date, clock_in, clock_out, status

8. Suggested Technology Stack

Layer	Recommended Options
Frontend (website)	React/Next.js, or a lighter HTML/CSS/JS + Tailwind build for faster delivery
Admin dashboard	React (same framework as frontend, shared components) with a clean card/chart-based UI
Backend/API	Node.js + Express, or Laravel (PHP), or Django (Python) — any are solid choices

Database	PostgreSQL or MySQL
Authentication	JWT-based auth with role-based access control
SMS/WhatsApp	Africa's Talking, or Twilio, or WhatsApp Business API directly
Mobile Money	MTN Mobile Money API, Airtel Money API
Hosting	Any standard cloud host (e.g., DigitalOcean, AWS) with automated backups enabled

9. Non-Functional Requirements

- Security: role-based permissions, hashed passwords, HTTPS everywhere, full audit log on financial actions.
 - Performance: dashboard pages should load key stats in under 2 seconds even with years of transaction history — use pagination and indexed queries.
 - Backups: automated daily backups, retained for at least 30 days.
 - Scalability: schema and architecture should support a second branch without redesign.
 - Accessibility & localization: support English, Kinyarwanda, and French from the start if the client base needs it.
-

10. Implementation Roadmap

Phase	Scope
Phase 1 — MVP	Website (Home, Services, About, Contact, basic booking form), Admin (worker management across all categories — barbers, hairstylists, nail technicians — service management, transaction recording with automatic commission calculation, basic overview dashboard with calendar income view)
Phase 2 — Automation	Real-time booking calendar, SMS/WhatsApp reminders, automated payroll & payslips with the live calendar salary tracker, client CRM, loyalty tracking, reports & analytics
Phase 3 — Growth	Mobile Money payment integration, inventory management, marketing campaigns & promo codes, multi-branch support, worker self-service login/app

11. Open Decisions for the Owner

A few things only the business owner can decide — worth settling before development starts:

1. Is the 20% commission rate the same for every worker, or should senior/specialist staff earn more?
2. Should discounts reduce the worker's commission, or should the worker still earn commission on the full price?

3. Should tips be tracked in the system, and do they go 100% to the worker?
4. What pay period should payroll run on — weekly, bi-weekly, or monthly?
5. Which payment methods will the salon actually accept at launch (cash only, or also MTN MoMo/Airtel Money/card)?
6. Should workers get their own login to see their own schedule and earnings?
7. Are there non-service staff (receptionist, cleaner) who need fixed-salary payroll alongside the commission-based workers?
8. Should commission rates differ by category (e.g., barbers at 20%, hairstylists and nail technicians at a different rate), or should every worker earn the same 20% regardless of category?
9. Should services be locked to their matching category (only nail technicians bookable for manicures), or should any trained worker be bookable for any service?

End of documentation.
